## Description

Convolute "Flexi-Flue" is a stripwound pipe, made from 304 grade stainless steel strip at our state of the art manufacturing facilities in Seven Hills, NSW. The stainless steel strip is helically wound after being formed into a continuously interlocked profile, which provides both strength and flexibility.

## Application

Convolute "Flexi-Flue" is an excellent internal chimney liner for converting existing open fireplaces. The one-piece flexible design makes installation easier in tight and angled situations, compared with straight pipes which have to be custom cut, angled and joined.

It is the perfect ducting solution for fireplaces and wood burning stoves, and can handle temperatures up to 750°C.
